

Properties of real networks: degree distribution

Nodes with small degrees are most frequent.

The fraction of highly connected nodes decreases, but is not zero.

Look closer: use a logarithmic plot.

Plotting **power laws** and **exponentials**

Note: these are plots of functions and not degree distributions

In- and out-degree distribution of the WWW

nodes: webpages
edges: hyperlinks

$$P_{out}(k) \approx k^{-2.45}$$

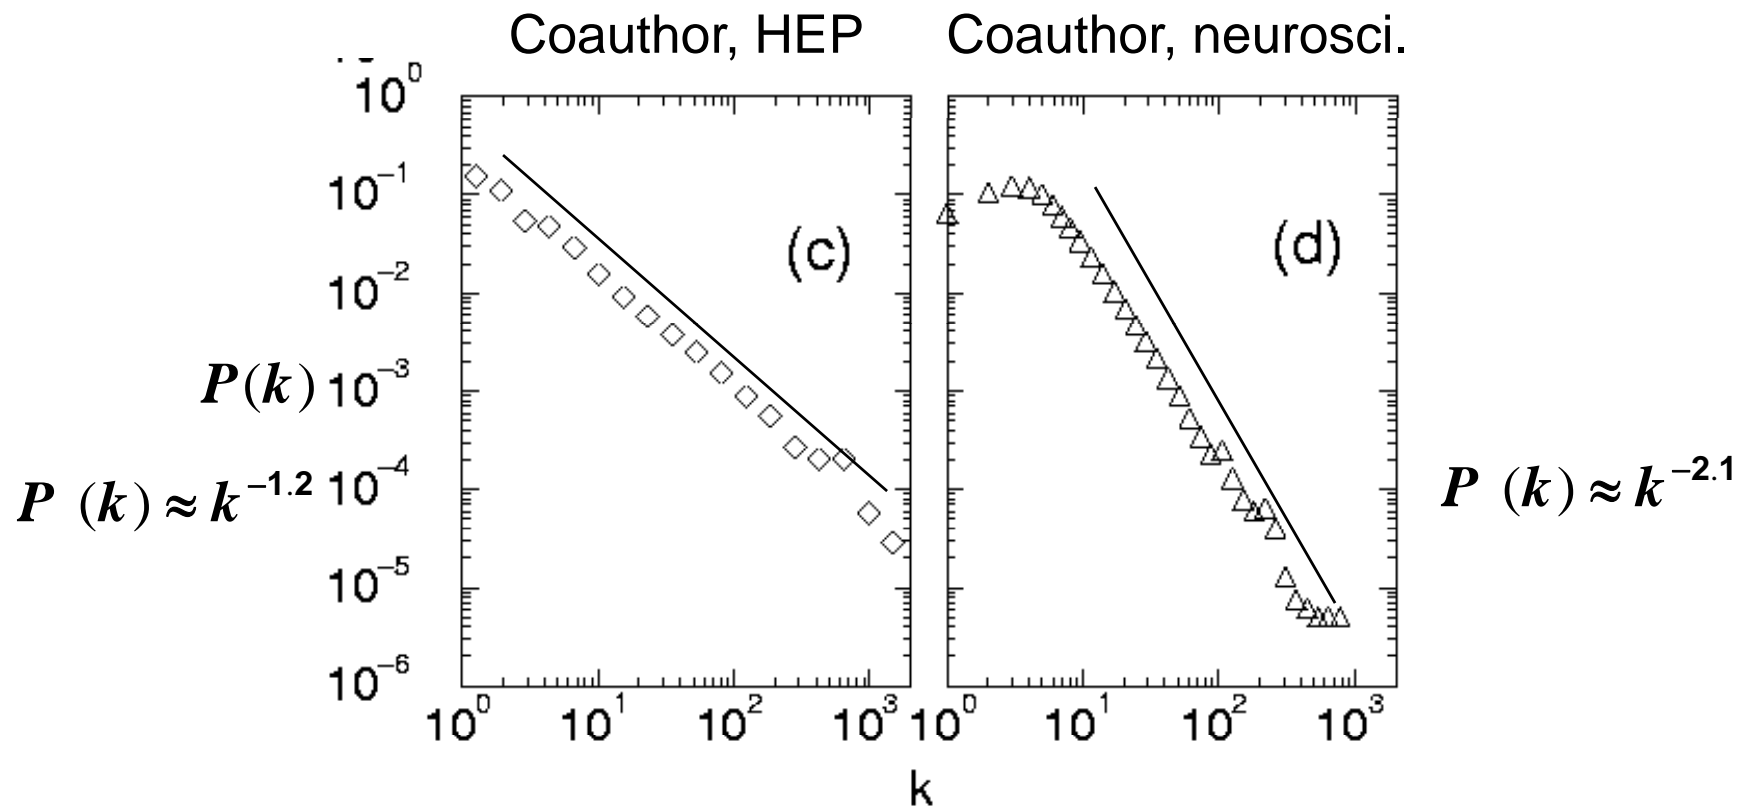

$$P_{in}(k) \approx k^{-2.1}$$

Usage: the degree distribution **scales as** a power law

Metabolic networks have a power-law degree distribution

E. coli

bipartite

nodes: metabolites,
reactions

directed edges,
out: reactant (substrate)
in: product of reaction

H. Jeong et al., Nature 407, 651 (2000)

Cleaning up degree distributions

Often it is difficult to determine the best fit to the points that make up a degree distribution.

Methods of data cleanup:

1. logarithmic binning: bin the k range; use bins of exponentially increasing size
2. Display the cumulative degree distribution

$$P(k \leq K) = \sum_{k=k_{min}}^K P(k) \text{ or}$$

$$P(k > K) = 1 - P(k \leq K)$$

Ex. Determine the degree distribution and cumulative degree distribution of the graph on the right.

If the (noncumulative) degree distribution aligns with a power law with exponent $\alpha > 1$, the cumulative degree distribution will align with a power law with exponent $\alpha - 1$. Does not apply for $\alpha = 1$!

Power grid has exponential degree distribution

nodes: generators,
power stations
edges: power lines

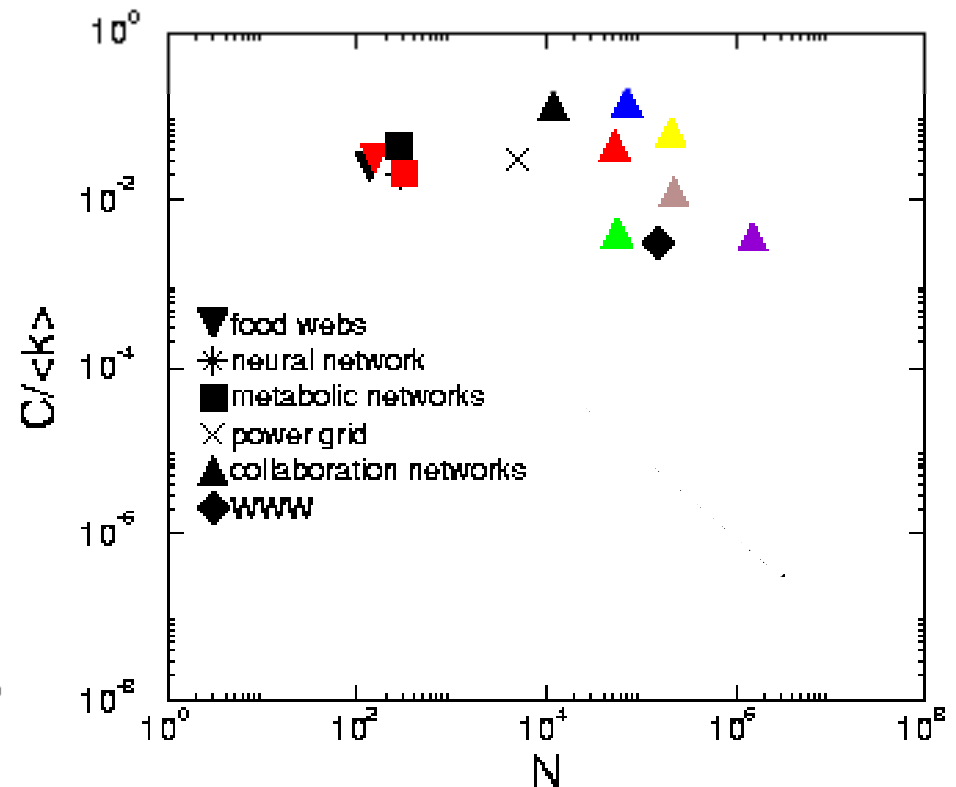

$$P(k > K) \propto \exp(-0.5K)$$

R. Albert, I. Albert, G. L. Nakarado, Phys. Rev. E 69, 025103(R) (2004)

Path length and order in real networks

$$l \approx \frac{\log N}{\log \langle k \rangle}$$

$$C \propto \langle k \rangle$$

Apparent scaling with the network size and average degree - as though these different networks were members of the same family.

Distribution of betweenness centrality

Coauthorship
Protein interaction
Metabolic netw.

$$P_B(g) \approx g^{-2.2}$$

World-wide Web
Internet (AS level)

$$P_B(g) \approx g^{-2}$$

K. I. Goh et al., PNAS 99, 12583 (2002)

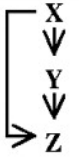

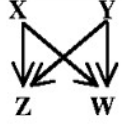

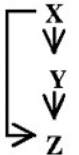

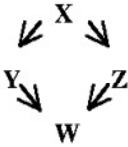

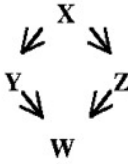

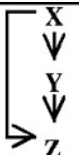

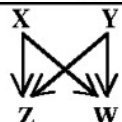

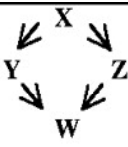

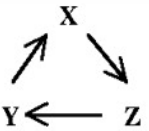

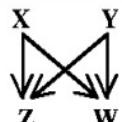

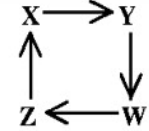

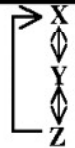

Betweenness centrality (load) distribution of the power grid

$$P(l > L) \approx (2500 + L)^{-0.7}$$

Q: How does the non-cumulative distribution look like in the region where the cumulative distribution is almost horizontal?

R. Albert, I. Albert, G. L. Nakarado, Phys. Rev. E 69, 025103(R) (2004)

Mixing patterns in networks

Mixing in social networks

assortative: people prefer to associate with others who are like them

disassortative: people prefer to associate with others who are different

Mixing with respect of node degree:

assortative: high degree nodes tend to be connected to high degree nodes

disassortative: high degree nodes tend to be connected to low degree nodes

Focus on edge i , denote the excess in-degree of its starting point with j_i and the excess out-degree of its endpoint with k_i

Mixing is quantified by the correlation between j_i and k_i over all i

$$r = \frac{\sum_i j_i k_i - \sum_i j_i \sum_{i'} k_{i'} / N}{\left(\sum_i j_i^2 - (\sum_i j_i)^2 / N \right)^{0.5} \left(\sum_i k_i^2 - (\sum_i k_i)^2 / N \right)^{0.5}}$$

Positive correlation - assortative, Negative correlation - disassortative

| | network | type | size n | assortativity r | error σ_r | ref. |
|---------------|---------------------------|------------|----------|-------------------|------------------|------|
| social | physics coauthorship | undirected | 52909 | 0.363 | 0.002 | a |
| | biology coauthorship | undirected | 1520251 | 0.127 | 0.0004 | a |
| | mathematics coauthorship | undirected | 253339 | 0.120 | 0.002 | b |
| | film actor collaborations | undirected | 449913 | 0.208 | 0.0002 | c |
| | company directors | undirected | 7673 | 0.276 | 0.004 | d |
| | student relationships | undirected | 573 | -0.029 | 0.037 | e |
| | email address books | directed | 16881 | 0.092 | 0.004 | f |
| technological | power grid | undirected | 4941 | -0.003 | 0.013 | g |
| | Internet | undirected | 10697 | -0.189 | 0.002 | h |
| | World-Wide Web | directed | 269504 | -0.067 | 0.0002 | i |
| | software dependencies | directed | 3162 | -0.016 | 0.020 | j |
| biological | protein interactions | undirected | 2115 | -0.156 | 0.010 | k |
| | metabolic network | undirected | 765 | -0.240 | 0.007 | l |
| | neural network | directed | 307 | -0.226 | 0.016 | m |
| | marine food web | directed | 134 | -0.263 | 0.037 | n |
| | freshwater food web | directed | 92 | -0.326 | 0.031 | o |

Social networks tend to be assortative, technological and biological networks tend to be disassortative.

Possible causes of assortativity: attraction of similars, group affiliation

Possible cause of disassortativity: service relationships (e.g. directories)

M. E. J. Newman, Phys. Rev. E (2003)

Universality in large-scale networks

The degree distribution follows a decreasing function, usually a power-law.

The betweenness centrality distribution is also decreasing.

Both indicate **heterogeneity** and the existence of **hubs**.

The distances scale logarithmically with the network size

$$l \approx \frac{\log N}{\log \langle k \rangle}$$

The clustering coefficient does not seem to depend on the network size and it seems to be proportional with the average degree

$$C \propto \langle k \rangle$$

Frequent subgraphs – not universal but common to several networks
